

Effectively Working with Biostatisticians as Collaborators

ARI Webinar: Succeeding in Mental Health and Aging Research

April 11, 2023

Adam Ciarleglio, PhD

Department of Biostatistics and Bioinformatics

THE GEORGE WASHINGTON UNIVERSITY

WASHINGTON, DC

Outline

- Collaboration
 - What is a biostatistician and how can you collaborate with them?
- Logistics
 - Finding a biostatistician and thinking about effort.
- Additional Considerations
 - Some things to think about when working with a biostatistician.

Collaboration

What is a Biostatistician?

- A biostatistician is a **person** who applies principles of study design and statistical methodology to address public health/biomedical research questions.
- Typical activities for a biostatistician:
 - Study design
 - Power and sample size determination
 - Generate randomization plans
 - Write statistical analysis sections of grants
 - Data cleaning and wrangling
 - Analysis
 - Presenting results
 - Working with co-investigators to write manuscripts
 - ...
- Many biostatisticians also devote time to developing new statistical methods to address problems that need solutions.

Emerging Roles for Biostatisticians

Pitch for the Collaborative Mindset

- Many biostatisticians are interested in leading projects/papers.
- Many are also interested in developing new statistical methods to address challenging problems that need solutions.
- Many biostatisticians are on the lookout for interesting projects where novel methods can be judiciously applied.
- Develop a symbiotic relationship.
 - You might get to be an author on a statistical methods paper!
- Building a collaboration will pay dividends with respect to future projects.
 - Even if project/grant requires standard analysis (simple power calculations, straightforward application of methods, etc.), be forward thinking.

Developing Careers Together

- While it may be advantageous to have a senior biostatistician on your grant, there are benefits to finding one who is at a similar stage in their career as you are.
 - Senior biostatisticians may be invested in long-established collaborations.
- Some (hopefully) obvious comments:
 - People like to work with people that they trust.
 - People like to work with people who see their contributions as crucial.
 - People probably work a little bit harder for those who appreciate them.

More on Collaboration and Developing Careers Together

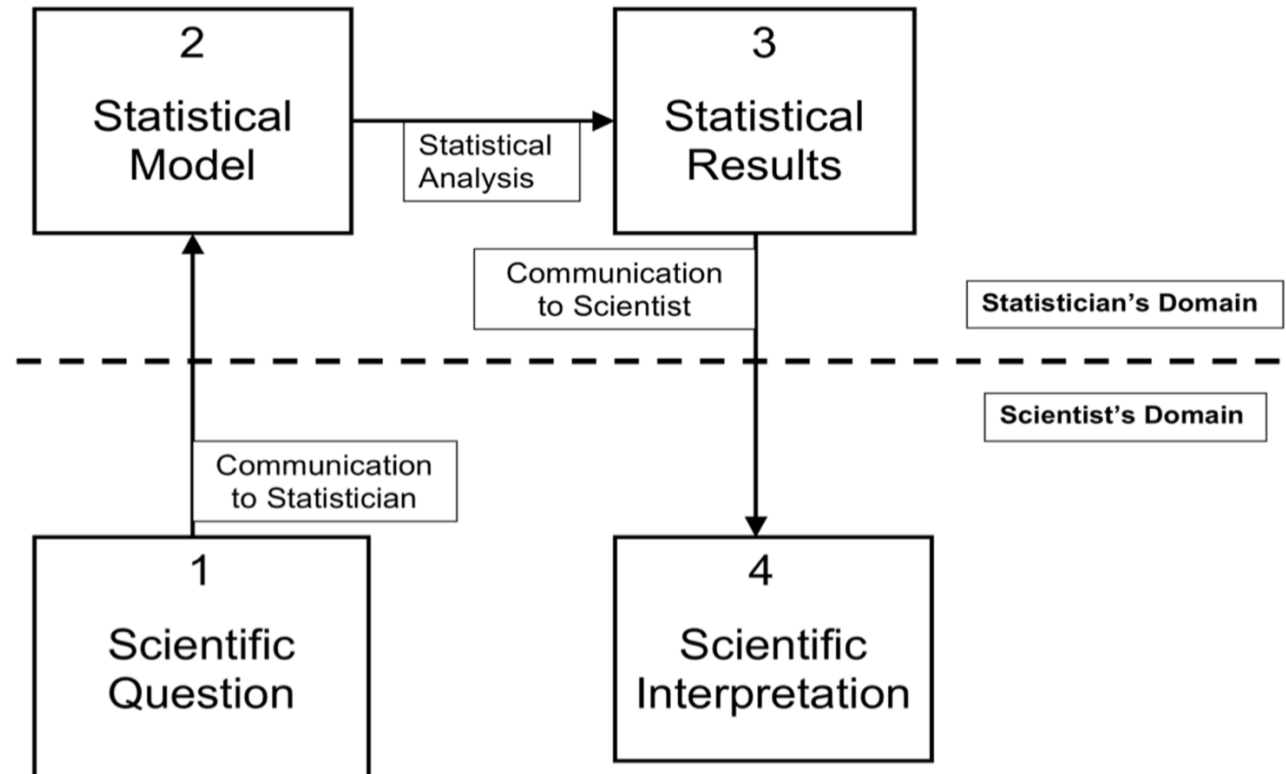

Figure 1. A Simplified Model of Collaborative Statistical Practice

Samsa, G. A day in the life of a collaborative biostatistician deconstructed: Implications for curriculum design. *Journal of Curriculum and Teaching*. (2018) 7(1): 20 – 31. (<https://files.eric.ed.gov/fulltext/EJ1167186.pdf>)

Example of Successful Collaboration

- **Elizabeth Matsui, MD** (Professor of Population Health and Pediatrics, Dell Medical School UT Austin)
- **Roger Peng, PhD** (Professor of Statistics and Data Science, University of Texas, Austin)

- Book: *The Art of Data Science* (<https://leanpub.com/artofdatascience>)

- Blog: *Simply Statistics* (<https://simplystatistics.org>)

- Podcast: *The Effort Report* (<http://theeffortreport.com/>)

The Care and Feeding of the Biostatistician

- Title of a *Simply Statistics* blog post by Elizabeth Matsui
 - <https://simplystatistics.org/2013/10/08/the-care-and-feeding-of-the-biostatistician/>
- Her suggestions/comments:
 - The biostatistician is not a computational tool.
 - Teach them your language.
 - Try to learn their language.
 - Draw pictures.
 - Be willing to share your data and your ideas.
 - Be respectful of time. (Not in original list.)

Biostatistician's Impact in a Grant Review

- Consider R01 scoring – Having a biostatistician as a co-investigator can impact:
 - **Investigators**
 - Reviewers tend to appreciate statistical expertise among investigators.
 - **Approach**
 - Sound statistical analysis section is crucial.
 - **Innovation**
 - Could possibly include statistical methods development or application of appropriate cutting edge methods.
 - **Overall Score**

Biostatistician's Impact in a Manuscript Review

- Many journals have statistical reviewers who focus on soundness the statistical analyses used.
 - Even if no dedicated statistical reviewer, usually have at least one savvy reviewer who can tell when things aren't right.
- If reviewers find issues with statistical analysis, they often suggest finding a biostatistician.
 - It's challenging to bring in a biostatistician after the paper has been submitted.
 - Possibly longer time to resubmission.

Logistics

Finding a Biostatistician I

- Does your department/division/group have a dedicated biostatistician?
- Is there a Biostatistics Department at your institution?
 - Many Biostatistics Departments have consulting services available for brief consultations.
 - There may be a Biostatistics, Epidemiology, and Research Design (BERD) program as part of a CTSI.
- You may need to reach outside of your institution
 - If so, there may be a lot to think about: e.g., compensation structure, data access, etc.

Finding a Biostatistician II

- Go in with the mindset of wanting to find a collaborator.
- If you have options for who can be your biostatistician:
 - Meet briefly with your potential collaborators.
 - Take time to review CVs, publications, grants.
 - Try to get an idea of whether the biostatistician has interests/skills that could serve to strengthen your research.

Initiating a Collaboration with a Biostatistician

- When you have a project/grant idea, reach out to your biostatistician ASAP.
- Waiting too long to involve a biostatistician can be ruinous.

Initiating a Project with a Biostatistician

- When you have a project/grant idea, reach out to your biostatistician ASAP.
 - Waiting too long to involve a biostatistician can be ruinous.
- Bring as detailed a draft as possible and be open to refining research questions.
 - The biostatistician is likely to ask questions about the variables that you plan to collect and associations that you plan to investigate.
- Be clear about what you are expecting.
 - Randomization
 - Data management
 - Data archiving
 - ...

Involving a Biostatistician Late in a Project

- Try to avoid this. When it cannot be avoided, have realistic expectations.
- Ex. You run analyses, write up paper, submit, and reviews come back saying that you need a biostatistician.
 - If you have funds:
 - Give time to get familiar with the data.
 - Biostatistician may take a different approach to analysis.
 - Results may be different.
 - If you plan to run new analyses yourself:
 - Biostatistician may not be able to give best advice without seeing the data.
 - May not be proficient with the software you are using.
 - ...

Time and Effort I

- No hard-and-fast rules for determining percent effort.
- Your institution/group may have norms that you should follow.
- In my experience, no one wants to be on 20 projects at 5% effort each.
- 5% effort about covers the services rendered in preparing a grant application.
 - Ex. 5% might cover:
 - planning meetings,
 - power and sample size analysis,
 - writing grant sections, and
 - maybe 1 – 1.5 hour weekly meetings during grant period
 - no analysis

Time and Effort II

- Common for PhD level biostatisticians to require additional funding to cover master's level biostatistician working with them.
- For many grants, may make sense to increase percent effort over life of the grant.

- Ex.

Year 1	Year 2	Year 3	Year 4	Year 5
PhD: 5% MS: 0%	PhD: 5% MS: 0%	PhD: 10% MS: 10%	PhD: 10% MS: 10%	PhD: 15% MS: 10%

Additional Considerations

Help Statisticians Understand the Data

- Consider bringing the data analyst (might be master's level statistician or PhD student) in to witness data collection if possible
 - For example, cognitive assessment battery, lab-generated data, ...
 - Help understand
 - the meaning of the variables
 - quality of the data
 - what could go wrong – why data might be missing or miscoded
 - how to interpret anomalies

Discussing Hypotheses

- Operationalize: X, Y, P
- Biostatistician will push you to identify key variables and how they are measured.
 - Think about causal relationships between variables. Potential confounders.
- Specify primary, secondary, and exploratory aims/hypotheses.
- Power and sample size geared towards primary aims.
 - Doing an appropriate power/sample size analysis can time.
- For grant writing: the better the biostatistician understands your proposed project, the better they can integrate the statistical analysis section into the proposal.

High Dimensional Data and Machine Learning Methods

- If you plan to obtain and use high dimensional data (e.g., brain imaging data, data from wearable devices, etc.) try to find someone who specializes in analysis of this kinds of data.
- Not all biostatisticians are well-versed in handling high dimensional data or machine learning methods.

Wrap-Up: Final Thoughts

- Sound application of statistical methods is crucial for successful projects, grants, and manuscripts.
- Try to develop a collaborative relationship with your biostatistician.
- Be prepared to teach each other and to learn from each other.
- Have realistic expectations about the biostatistical support you need and engage as early as possible.

Thank You!
